Full **Stack** Engineer

As a Full Stack Engineer, you will be helping design our core platform, working closely with the founders to make key product decisions, and building cool tech for our customers as we enable the future of transportation.

We're excited to launch Drumkit, an AI-powered assistant to manage the overwhelming amount of emails and tasks that operations teams in logistics companies manage in order to keep our supply chain running. You will play an enormous role in shaping Drumkit and making it a success!

Your role will include architecting and building connections to all the critical tools and infrastructure that our customers use to enable our automated workflows. You will also build and design the core infrastructure around our AI and application tooling.

Finally, you will help build a repeatable and consistent process for onboarding new customers and getting them up and running quickly!

Our current technology stack is in Go, React, Postgres, and AWS. And we're a remote-friendly company with folks across the East Coast.

Roles and Responsibilities

- Help structure and shape core tenets of the product
- Exhibit thought and technical leadership
- Design and build repeatable, well-documented processes and code
- Build full-stack user experiences for customers with a focus on the back-end, and designing distributed systems

Qualifications
